PUZZLING US BUSINESS CYCLE FALL 2019

(a) Unemployment rate

(b) Fed funds rate target, upper limit

(c) Market-based inflation expectations, 10 year, average

THIS PROJECT

Model anchored expectations as an endogenous gain learning scheme

- How to conduct optimal monetary policy in interaction with the anchoring expectation formation?

PREVIEW OF RESULTS

- ① intertemporal tradeoff: short-run costs vs. long-run benefits of anchoring expectations
 - ② optimal monetary policy time-inconsistent
- illustrate in special case: target criterion

RELATED LITERATURE

- **Optimal monetary policy in New Keynesian models**

- **Anchoring / endogenous gain**

Carvalho et al (2019), Svensson (2015), Hooper et al (2019), Milani (2014)

STRUCTURE OF TALK

① MODEL

② RAMSEY PROBLEM FOR SPECIAL CASE

HOUSEHOLDS - STANDARD UP TO $\hat{\mathbb{E}}$

Maximize lifetime expected utility

$$\hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} \left[U(C_T^i) - \int_0^1 v(h_T^i(j)) dj \right] \quad (1)$$

Budget constraint

$$B_t^i \leq (1 + i_{t-1})B_{t-1}^i + \int_0^1 w_t(j)h_t^i(j) + \Pi_t^i(j)dj - T_t - P_t C_t^i \quad (2)$$

► Consumption, price level

FIRMS - STANDARD UP TO $\hat{\mathbb{E}}$

Maximize present value of profits

$$\hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \alpha^{T-t} Q_{t,T} \left[\Pi_t^j(p_t(j)) \right] \quad (3)$$

subject to demand

$$y_t(j) = Y_t \left(\frac{p_t(j)}{P_t} \right)^{-\theta} \quad (4)$$

► Profits, stochastic discount factor

EXPECTATIONS - $\hat{\mathbb{E}}$ INSTEAD OF \mathbb{E}

- If use \mathbb{E} (rational expectations, RE)

Model solution

$$s_t = hs_{t-1} + \epsilon_t \quad (5)$$

$$y_t = gs_t \quad (6)$$

$$s_t \equiv (r_t^n, u_t)' \quad (\text{states})$$

$$y_t \equiv (\pi_t, x_t, i_t)' \quad (\text{jumps})$$

- If use $\hat{\mathbb{E}} \rightarrow$ don't know g
 \rightarrow estimate using observed states & knowledge of (5)

ADAPTIVE LEARNING

- Estimate g using recursive least squares (RLS)

→ nonrational expectations:

$$\hat{\mathbb{E}}_t y_{t+1} = \phi_{t-1} \begin{bmatrix} 1 \\ s_t \end{bmatrix} \quad (7)$$

- Note: misspecified

Can write:

$$\hat{\mathbb{E}}_t y_{t+1} = a_{t-1} + b_{t-1} s_t \quad (8)$$

In RE, $a_{t-1} = (0, 0, 0)'$, $b_{t-1} = g \quad \forall t$

ANCHORING - ENDOGENOUS GAIN

Special case: learn only intercept of inflation:

$$a_{t-1} = (\bar{\pi}_{t-1}, 0, 0)', b_{t-1} = g \quad \forall \quad (9)$$

→ RLS

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \underbrace{k_t \left(\pi_t - (\bar{\pi}_{t-1} + b s_{t-1}) \right)}_{\equiv fe_{t|t-1}, \text{ forecast error}} \quad (10)$$

► General RLS algorithm

Gain in literature usually exogenous:

$$k_t = \begin{cases} \frac{1}{t} & \text{decreasing} \\ k & \text{constant} \end{cases}$$

Here instead

$$k_t = k_{t-1} + \mathbf{g}(fe_{t|t-1}) \quad (11)$$

ANCHORING FUNCTION - INTERPRETATION

$$k_t = k_{t-1} + \mathbf{g}(fe_{t|t-1})$$

FIGURE: U Michigan inflation expectations (%)

- If gain nondecreasing, $\bar{\pi}$ changes \rightarrow *unanchored expectations*
- If gain decreasing, $\bar{\pi}$ stable \rightarrow *anchored expectations*

MODEL SUMMARY

- IS- and Phillips curve:

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} ((1-\beta)x_{T+1} - \sigma(\beta i_{T+1} - \pi_{T+1}) + \sigma r_T^n) \quad (12)$$

$$\pi_t = \kappa x_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\alpha\beta)^{T-t} (\kappa\alpha\beta x_{T+1} + (1-\alpha)\beta\pi_{T+1} + u_T) \quad (13)$$

► Derivations

- Expectations evolve according to RLS with the endogenous gain given by (11)

→ How should $\{i_t\}$ be set?

STRUCTURE OF TALK

① MODEL

② RAMSEY PROBLEM FOR SPECIAL CASE

RAMSEY PROBLEM

$$\max_{\{y_t, \phi_{t-1}, k_t\}_{t=t_0}^{\infty}} \mathbb{E}_{t_0} \sum_{t=t_0}^{\infty} \beta^{t-t_0} (\pi_t^2 + \lambda_x x_t^2)$$

s.t. model equations

- \mathbb{E} is the central bank's (CB) expectation
- Assumption: CB observes private expectations and knows the model

SPECIAL CASE

- Only inflation intercept learned
- Anchoring function simplified to

$$k_t = \mathbf{g}(fe_{t|t-1}) \quad (14)$$

TARGET CRITERION FOR SPECIAL CASE

RESULT

In the simplified model with anchoring, monetary policy optimally brings about the following target relationship between inflation and the output gap

$$\pi_t = -\frac{\lambda_x}{\kappa} \left\{ x_t - \frac{(1-\alpha)\beta}{1-\alpha\beta} \left(k_t + ((\pi_t - \bar{\pi}_{t-1} - b_1 s_{t-1})) \mathbf{g}_{\pi,t} \right) \right. \\ \left. \left(\mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \prod_{j=0}^{i-1} (1 - k_{t+1+j} - (\pi_{t+1+j} - \bar{\pi}_{t+j} - b_1 s_{t+j}) \mathbf{g}_{\bar{\pi},t+j}) \right) \right\}$$

where $\mathbf{g}_{z,t} \equiv \frac{\partial \mathbf{g}}{\partial z}$ at t , $\prod_{j=0}^0 \equiv 1$ and b_1 is the first row of b .

INTERPRETATION - INTERTEMPORAL TRADEOFFS

$$\pi_t = -\frac{\lambda_x}{\kappa} x_t + \frac{\lambda_x (1-\alpha)\beta}{\kappa (1-\alpha\beta)} \left(k_t + fe_{t|t-1} g_{\pi,t} \right) \mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \\ - \frac{\lambda_x (1-\alpha)\beta}{\kappa (1-\alpha\beta)} \left(k_t + fe_{t|t-1} g_{\pi,t} \right) \mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \prod_{j=0}^{i-1} (k_{t+1+j} + fe_{t+1+j|t+j}) g_{\pi,t+j}$$

tradeoffs from discretion in RE

+ effect of current level and change of the gain on future tradeoffs

+ effect of future expected levels and changes of the gain on future tradeoffs

LEMMA

The commitment solution of the Ramsey problem does not exist.

Let $k_t \rightarrow 0$, $g_{z,t} \rightarrow 0$.

Target criterion becomes

$$\pi_t = -\frac{\lambda_x}{\kappa} x_t \quad (15)$$

= target criterion under RE discretion

COROLLARY

Optimal policy is time-inconsistent.

Already true for exogenous gain learning!

Constant gain specification:

- $k_t = k$
- $g_{z,t} = 0$ (still)

$$\pi_t = -\frac{\lambda_x}{\kappa} x_t + \frac{\lambda_x}{\kappa} \frac{(1-\alpha)\beta}{1-\alpha\beta} k \left(\sum_{i=1}^{\infty} x_{t+i} (1-k)^i \right) \quad (16)$$

→ A first intertemporal tradeoff

ANCHORING AS A SECOND INTERTEMPORAL TRADEOFF

$$\pi_t = -\frac{\lambda_x}{\kappa} x_t + \frac{\lambda_x (1-\alpha)\beta}{\kappa (1-\alpha\beta)} \left(k_t + f e_{t|t-1} g_{\pi,t} \right) \mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \\ - \frac{\lambda_x (1-\alpha)\beta}{\kappa (1-\alpha\beta)} \left(k_t + f e_{t|t-1} g_{\pi,t} \right) \mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \prod_{j=0}^{i-1} (k_{t+1+j} + f e_{t+1+j|t+j}) g_{\bar{\pi},t+j}$$

+ first intertemporal tradeoff from stance of learning

+ second intertemporal tradeoff from stance of anchoring

Thank you!

DETAILS ON HOUSEHOLDS AND FIRMS

Consumption:

$$C_t^i = \left[\int_0^1 c_t^i(j)^{\frac{\theta-1}{\theta}} dj \right]^{\frac{\theta}{\theta-1}} \quad (17)$$

$\theta > 1$: elasticity of substitution between varieties

Aggregate price level:

$$P_t = \left[\int_0^1 p_t(j)^{1-\theta} dj \right]^{\frac{1}{\theta-1}} \quad (18)$$

Profits:

$$\Pi_t^j = p_t(j)y_t(j) - w_t(j)f^{-1}(y_t(j)/A_t) \quad (19)$$

Stochastic discount factor

$$Q_{t,T} = \beta^{T-t} \frac{P_t U_c(C_T)}{P_T U_c(C_t)} \quad (20)$$

RECURSIVE LEAST SQUARES ALGORITHM

$$\phi_t = \left(\phi'_{t-1} + k_t^{-1} R_t^{-1} \begin{bmatrix} 1 \\ s_{t-1} \end{bmatrix} \left(y_t - \phi_{t-1} \begin{bmatrix} 1 \\ s_{t-1} \end{bmatrix} \right)' \right)' \quad (21)$$

$$R_t = R_{t-1} + k_t^{-1} \left(\begin{bmatrix} 1 \\ s_{t-1} \end{bmatrix} [1 \quad s_{t-1}] - R_{t-1} \right) \quad (22)$$

DERIVATIONS

Household FOCs

$$\hat{c}_t^i = \hat{\mathbb{E}}_t^i \hat{c}_{t+1}^i - \sigma(\hat{i}_t - \hat{\mathbb{E}}_t^i \hat{\pi}_{t+1}) \quad (23)$$

$$\hat{\mathbb{E}}_t^i \sum_{s=0}^{\infty} \beta^s \hat{c}_t^i = \omega_t^i + \hat{\mathbb{E}}_t^i \sum_{s=0}^{\infty} \beta^s \hat{y}_t^i \quad (24)$$

where ‘hats’ denote log-linear approximation and $\omega_t^i \equiv \frac{(1+i_{t-1})B_{t-1}^i}{p_t Y^*}$.

- ① Solve (23) backward to some date t , take expectations at t
 - ② Sub in (24)
 - ③ Aggregate over households i
- Obtain (12)

COMPACT NOTATION

$$z_t = A_1 f_{a,t} + A_2 f_{b,t} + A_3 s_t \quad (25)$$

$$s_t = h s_{t-1} + \epsilon_t \quad (26)$$

where

$$z_t \equiv \begin{pmatrix} \pi_t \\ x_t \\ i_t \end{pmatrix} \quad s_t \equiv \begin{pmatrix} r_t^n \\ \bar{i}_t \\ u_t \end{pmatrix} \quad (27)$$

and

$$f_{a,t} \equiv \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\alpha \beta)^{T-t} z_{T+1} \quad f_{b,t} \equiv \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\beta)^{T-t} z_{T+1} \quad (28)$$
