

Monetary Policy & Anchored Expectations

An Endogenous Gain Learning Model

Laura Gáti

Boston College

ZEW

21 January 2021

Anchoring

Tversky & Kahneman (1974):

- Tell people a random number (e.g. 10)
- Ask people to estimate some percentage
(e.g. % of African countries in the United Nations)

Anchoring

Tversky & Kahneman (1974):

- Tell people a random number (e.g. 10)
 - Ask people to estimate some percentage
(e.g. % of African countries in the United Nations)
- People will guess in the ballpark of the number you told them
(average guess was 25)

Anchoring

Tversky & Kahneman (1974):

- Tell people a random number (e.g. 10)
 - Ask people to estimate some percentage
(e.g. % of African countries in the United Nations)
- People will guess in the ballpark of the number you told them
(average guess was 25)
- ⇒ Inflation expectations can anchor and unanchor too?

“Essential to anchor inflation expectations at some low level.”

“We don’t see a de-anchoring.”

“Failure of the Fed to stably achieve its 2 percent target could de-anchor inflation expectations.”

“Long-run inflation expectations [...] are not perfectly anchored in real economies; moreover, the extent to which they are anchored can change.”

This paper

- How to conduct monetary policy when expectations can become unanchored?
- Model of expectations unanchoring
 - ↪ extension to adaptive learning that captures time-varying responsiveness of long-run expectations
- Estimate how unanchoring takes place in data
 - ↪ quantify novel anchoring channel
- Analyze monetary policy
 - ↪ analytically and numerically using novel model disciplined by data

Preview of results

1. Estimation

- Expectations process is nonlinear

2. Optimal policy

- Responds aggressively to inflation when unanchored, accommodates inflation when anchored

3. Taylor rule

- Less aggressive on inflation than under rational expectations

Households: standard up to $\hat{\mathbb{E}}$

Maximize lifetime expected utility

$$\hat{\mathbb{E}}_t^i \sum_{T=t}^{\infty} \beta^{T-t} \left[U(C_T^i) - \int_0^1 v(h_T^i(j)) dj \right] \quad (1)$$

Budget constraint

$$B_t^i \leq (1 + i_{t-1})B_{t-1}^i + \int_0^1 w_t(j)h_t^i(j)dj + \Pi_t^i(j)dj - T_t - P_t C_t^i \quad (2)$$

► Consumption, price level

Firms: standard up to $\hat{\mathbb{E}}$

Maximize present value of profits

$$\hat{\mathbb{E}}_t^j \sum_{T=t}^{\infty} \alpha^{T-t} Q_{t,T} \left[\Pi_t^j(p_t(j)) \right] \quad (3)$$

subject to demand

$$y_t(j) = Y_t \left(\frac{p_t(j)}{P_t} \right)^{-\theta} \quad (4)$$

► Profits, stochastic discount factor

Expectations: $\hat{\mathbb{E}}$ instead of \mathbb{E}

- Model implies mapping between exogenous states s_t and observables $y_t \equiv (\pi_t, x_t, i_t)'$

$$y_t = g s_t \tag{5}$$

Expectations: $\hat{\mathbb{E}}$ instead of \mathbb{E}

- Model implies mapping between exogenous states s_t and observables $y_t \equiv (\pi_t, x_t, i_t)'$

$$y_t = g s_t \quad (5)$$

- Under rational expectations (RE), private sector knows model
→ knows (5)

$$\mathbb{E}_t y_{t+1} = g \mathbb{E}_t s_{t+1} \quad (6)$$

Expectations: $\hat{\mathbb{E}}$ instead of \mathbb{E}

- Model implies mapping between exogenous states s_t and observables $y_t \equiv (\pi_t, x_t, i_t)'$

$$y_t = g s_t \quad (5)$$

- Under rational expectations (RE), private sector knows model
→ knows (5)

$$\mathbb{E}_t y_{t+1} = g \mathbb{E}_t s_{t+1} \quad (6)$$

- $\hat{\mathbb{E}}$: agents do not internalize that identical → do not know aggregate model → do not know (5)

Adaptive learning

- Agents know evolution of exogenous states

$$s_{t+1} = hs_t + \epsilon_{t+1} \quad \epsilon_t \sim \mathcal{N}(\mathbf{0}, \Sigma) \quad (7)$$

Adaptive learning

- Agents know evolution of exogenous states

$$s_{t+1} = hs_t + \epsilon_{t+1} \quad \epsilon_t \sim \mathcal{N}(\mathbf{0}, \Sigma) \quad (7)$$

- Postulate linear functional relationship instead of (5):

$$\hat{\mathbb{E}}_t y_{t+1} = \hat{\mathbb{E}}_t \begin{pmatrix} \pi_{t+1} \\ x_{t+1} \\ i_{t+1} \end{pmatrix} = \begin{pmatrix} \bar{\pi}_t \\ 0 \\ 0 \end{pmatrix} + ghs_t \quad (8)$$

Adaptive learning

- Agents know evolution of exogenous states

$$s_{t+1} = hs_t + \epsilon_{t+1} \quad \epsilon_t \sim \mathcal{N}(\mathbf{0}, \Sigma) \quad (7)$$

- Postulate linear functional relationship instead of (5):

$$\hat{\mathbb{E}}_t y_{t+1} = \hat{\mathbb{E}}_t \begin{pmatrix} \pi_{t+1} \\ x_{t+1} \\ i_{t+1} \end{pmatrix} = \begin{pmatrix} \bar{\pi}_t \\ 0 \\ 0 \end{pmatrix} + ghs_t \quad (8)$$

$\bar{\pi}_t \rightarrow$ concept of long-run inflation expectations in the model

Adaptive learning

- Agents know evolution of exogenous states

$$s_{t+1} = hs_t + \epsilon_{t+1} \quad \epsilon_t \sim \mathcal{N}(\mathbf{0}, \Sigma) \quad (7)$$

- Postulate linear functional relationship instead of (5):

$$\hat{\mathbb{E}}_t y_{t+1} = \hat{\mathbb{E}}_t \begin{pmatrix} \pi_{t+1} \\ x_{t+1} \\ i_{t+1} \end{pmatrix} = \begin{pmatrix} \bar{\pi}_t \\ 0 \\ 0 \end{pmatrix} + ghs_t \quad (8)$$

$\bar{\pi}_t \rightarrow$ concept of long-run inflation expectations in the model

- Agents estimate $\bar{\pi}_t$ using observed states and knowledge of (7)

Updating $\bar{\pi}$

Let b_1 denote first row of gh .

One-period ahead inflation forecast:

$$\hat{\mathbb{E}}_{t-1} \pi_t = \bar{\pi}_{t-1} + b_1 s_{t-1} \quad (9)$$

Updating $\bar{\pi}$

Let b_1 denote first row of gh .

One-period ahead inflation forecast:

$$\hat{\mathbb{E}}_{t-1}\pi_t = \bar{\pi}_{t-1} + b_1s_{t-1} \quad (9)$$

One-period ahead inflation forecast error:

$$f_{t|t-1} = \pi_t - (\bar{\pi}_{t-1} + b_1s_{t-1}) \quad (10)$$

Updating $\bar{\pi}$

Let b_1 denote first row of gh .

One-period ahead inflation forecast:

$$\hat{\mathbb{E}}_{t-1}\pi_t = \bar{\pi}_{t-1} + b_1 s_{t-1} \quad (9)$$

One-period ahead inflation forecast error:

$$f_{t|t-1} = \pi_t - (\bar{\pi}_{t-1} + b_1 s_{t-1}) \quad (10)$$

→ Update for long-run inflation expectations:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k_t f_{t|t-1} \quad (11)$$

$k_t \in (0, 1)$ learning gain

Alternatives for the gain

1. Decreasing gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \frac{1}{t} f_{t|t-1} \quad (12)$$

2. Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

Alternatives for the gain

1. Decreasing gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \frac{1}{t} f_{t|t-1} \quad (12)$$

2. Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

3. Endogenous gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (14)$$

► Assumptions on $\mathbf{g}(\cdot)$

Alternatives for the gain

1. Decreasing gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \frac{1}{t} f_{t|t-1} \quad (12)$$

Optimal monetary policy: Mele et al 2019

2. Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

Optimal monetary policy: Molnár & Santoro 2014

3. Endogenous gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (14)$$

► Assumptions on $\mathbf{g}(\cdot)$

Alternatives for the gain

1. Decreasing gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \frac{1}{t} f_{t|t-1} \quad (12)$$

Optimal monetary policy: Mele et al 2019

2. Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

Optimal monetary policy: Molnár & Santoro 2014

3. Endogenous gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (14)$$

Marcet & Nicolini 2003, Carvalho et al 2019

Alternatives for the gain

1. Decreasing gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \frac{1}{t} f_{t|t-1} \quad (12)$$

Optimal monetary policy: Mele et al 2019

2. Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

Optimal monetary policy: Molnár & Santoro 2014

3. Endogenous gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (14)$$

Model summary

- New Keynesian core: IS and Phillips curves

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} \left((1 - \beta)x_{T+1} - \sigma(\beta i_{T+1} - \pi_{T+1}) + \sigma r_T^n \right) \quad (15)$$

$$\pi_t = \kappa x_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\alpha\beta)^{T-t} \left(\kappa\alpha\beta x_{T+1} + (1 - \alpha)\beta\pi_{T+1} + u_T \right) \quad (16)$$

► Derivations

► Actual laws of motion

Observables: $y_t = (\pi, x, i)'$ inflation, output gap, interest rate

Exogenous states: $s_t = (r_t^n, u_t)'$ natural rate and cost-push shock

Model summary

- New Keynesian core: IS and Phillips curves

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} \left((1 - \beta)x_{T+1} - \sigma(\beta i_{T+1} - \pi_{T+1}) + \sigma r_T^n \right) \quad (15)$$

$$\pi_t = \kappa x_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\alpha\beta)^{T-t} \left(\kappa\alpha\beta x_{T+1} + (1 - \alpha)\beta\pi_{T+1} + u_T \right) \quad (16)$$

► Derivations

► Actual laws of motion

Observables: $y_t = (\pi, x, i)'$ inflation, output gap, interest rate

Exogenous states: $s_t = (r_t^n, u_t)'$ natural rate and cost-push shock

- Expectations:

$$\hat{\mathbb{E}}_t \pi_{t+1} = \bar{\pi}_t + b_1 s_t \quad (17)$$

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (18)$$

Structure of talk

1. Model of anchoring expectations
2. Quantification of learning channel
3. Solving the Ramsey problem
4. Implementing optimal policy
5. Approximating optimal policy with a Taylor rule

Estimating form of gain function

- Calibrate parameters of New Keynesian core to literature
- Estimate flexible form of expectations process via simulated method of moments
(Duffie & Singleton 1990, Lee & Ingram 1991, Smith 1993)

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (18)$$

- Moments: autocovariances of inflation, output gap, federal funds rate and 1-year ahead Survey of Professional Forecasters (SPF) inflation expectations at lags $0, \dots, 4$

Calibration - parameters from the literature

β	0.98	stochastic discount factor
σ	1	intertemporal elasticity of substitution
α	0.5	Calvo probability of not adjusting prices
κ	0.0842	slope of the Phillips curve
ψ_π	1.5	coefficient of inflation in Taylor rule
ψ_x	0.3	coefficient of the output gap in Taylor rule
σ_r	0.01	standard deviation, natural rate shock
σ_i	0.01	standard deviation, monetary policy shock
σ_u	0.5	standard deviation, cost-push shock
\bar{g}	0.145	initial value of the gain

Chari et al 2000, Woodford 2003, Nakamura & Steinsson 2008
Carvalho et al 2019

Estimated expectations process

$$\bar{\pi}_t - \bar{\pi}_{t-1} = \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (18)$$

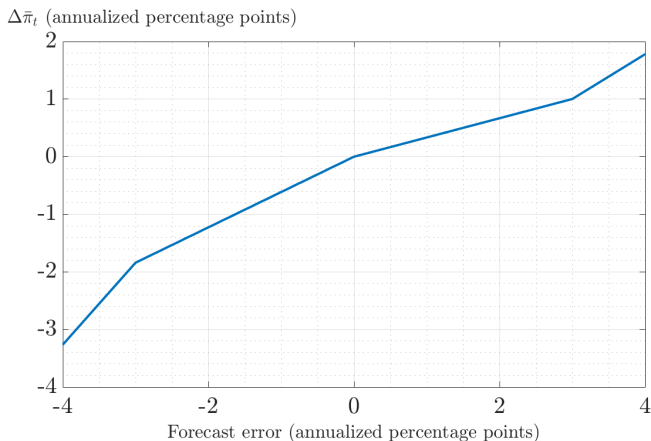

Figure: Changes in long-run inflation expectations as a function of forecast errors

Structure of talk

1. Model of anchoring expectations
2. Quantification of learning channel
3. Solving the Ramsey problem
4. Implementing optimal policy
5. Approximating optimal policy with a Taylor rule

Ramsey problem

$$\min_{\{y_t, \bar{\pi}_{t-1}, k_t\}_{t=t_0}^{\infty}} \mathbb{E}_{t_0} \sum_{t=t_0}^{\infty} \beta^{t-t_0} (\pi_t^2 + \lambda_x x_t^2)$$

s.t. model equations

s.t. evolution of expectations

- \mathbb{E} is the central bank's (CB) expectation
- Assumption: CB observes private expectations and knows the model

Target criterion

Proposition

Monetary policy optimally brings about the following target relationship between inflation and the output gap

$$\pi_t = -\frac{\lambda_x}{\kappa} x_t$$

RE (discretion): move π_t and x_t to offset cost-push shocks

Target criterion

Proposition

Monetary policy optimally brings about the following target relationship between inflation and the output gap

$$\pi_t - \Gamma k \mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} (1-k)^i = -\frac{\lambda_x}{\kappa} x_t$$

Adaptive learning (exogenous gain): can move $\mathbb{E}_t x_{t+i}$ too if $k > 0$,
where $\Gamma = \frac{\lambda_x}{\kappa} \frac{(1-\alpha)\beta}{1-\alpha\beta}$.

Target criterion

Proposition

Monetary policy optimally brings about the following target relationship between inflation and the output gap

$$\pi_t - \Gamma \left(k_t + f_{t|t-1} \mathbf{g}_{\pi,t} \right) \left(\mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \prod_{j=0}^{i-1} (1 - k_{t+1+j} - f_{t+1+j|t+j} \mathbf{g}_{\pi,t+j}) \right) = -\frac{\lambda_x}{\kappa} x_t$$

Endogenous gain: ability to move $\mathbb{E}_t x_{t+i}$ depends on present and future degree of unanchoring, where $\mathbf{g}_{z,t} \equiv \frac{\partial \mathbf{g}}{\partial z}$ at t .

Structure of talk

1. Model of anchoring expectations
2. Quantification of learning channel
3. Solving the Ramsey problem
4. Implementing optimal policy
5. Approximating optimal policy with a Taylor rule

Numerical solution procedure

Solve system of model equations + target criterion

For calibrated model with $\lambda_x = 0.05$ (Rotemberg & Woodford 1997),

↪ solve using parameterized expectations algorithm

↪ obtain a cubic spline approximation to optimal policy function

Optimal policy - responding to unanchoring

$i(\bar{\pi}, \text{all other states at their means})$

Stabilizing $\bar{\pi}$

5 bp movement in $\bar{\pi} \rightarrow 250$ bp movement in i

Optimal policy - responding to unanchoring

$i(\bar{\pi}, \text{all other states at their means})$

Stabilizing $\bar{\pi}$

5 bp movement in $\bar{\pi} \rightarrow 250$ bp movement in i

Mode: 0.3 bp movement in $\bar{\pi}$

Unanchoring causes volatility

Figure: Impulse responses after a cost-push shock when policy follows a Taylor rule

► Why oscillatory?

Volatility comes from endogenous gain

- Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

- Endogenous gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (14)$$

Volatility comes from endogenous gain

- Constant gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + k f_{t|t-1} \quad (13)$$

- Endogenous gain:

$$\bar{\pi}_t = \bar{\pi}_{t-1} + \mathbf{g}(f_{t|t-1}) f_{t|t-1} \quad (14)$$

Shocks raise the gain \rightarrow central bank needs to anchor

... and from positive feedback

IS curve:

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} ((1-\beta)x_{T+1} - \sigma(\beta i_{T+1} - \pi_{T+1}) + \sigma r_T^n)$$

- Unanchored $\rightarrow \bar{\pi}$ volatile $\rightarrow \hat{\mathbb{E}}_t \pi_{T+1}$ volatile

... and from positive feedback

IS curve:

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} ((1-\beta)x_{T+1} - \sigma(\beta i_{T+1} - \pi_{T+1}) + \sigma r_T^n)$$

- Unanchored $\rightarrow \bar{\pi}$ volatile $\rightarrow \hat{\mathbb{E}}_t \pi_{T+1}$ volatile
- $\rightarrow x_t$ volatile

Structure of talk

1. Model of anchoring expectations
2. Quantification of learning channel
3. Solving the Ramsey problem
4. Implementing optimal policy
5. Approximating optimal policy with a Taylor rule

Optimal Taylor-coefficient on inflation

$$i_t = \psi_\pi \pi_t + \psi_x x_t \quad (19)$$

Optimal Taylor-coefficient on inflation

$$i_t = \psi_\pi \pi_t + \psi_x x_t \quad (19)$$

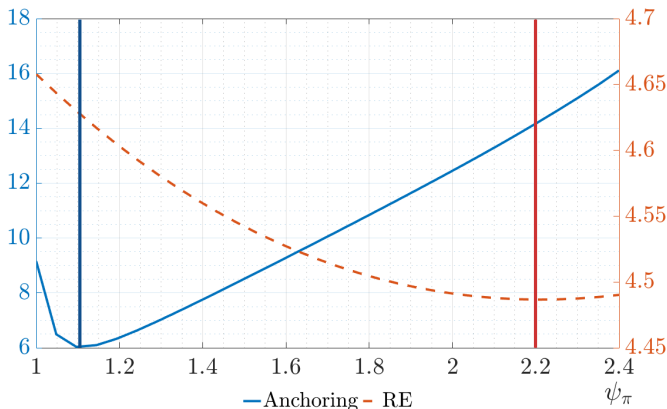

Figure: Central bank loss as a function of ψ_π

Optimal Taylor-coefficient on inflation

$$i_t = \psi_\pi \pi_t + \psi_x x_t \quad (19)$$

Figure: Central bank loss as a function of ψ_π

Anchoring-optimal coefficient: $\psi_\pi^A = 1.1$

RE-optimal coefficient: $\psi_\pi^{RE} = 2.2$

Why less aggressive? Future interest rate expectations

IS curve:

$$x_t = -\sigma \textcolor{red}{i}_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} ((1 - \beta)x_{T+1} - \sigma(\beta i_{T+1} - \pi_{T+1}) + \sigma r_T^n)$$

- Current interest rate i_t : one channel of policy

Why less aggressive? Future interest rate expectations

IS curve:

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} ((1-\beta)x_{T+1} - \sigma(\beta \textcolor{red}{i}_{T+1} - \pi_{T+1}) + \sigma r_T^n)$$

- Current interest rate i_t : one channel of policy
- Taylor rule implies interest rate expectation

$$\hat{\mathbb{E}}_t \textcolor{red}{i}_{t+k} = \psi_\pi \hat{\mathbb{E}}_t \pi_{t+k} + \psi_x \hat{\mathbb{E}}_t x_{t+k} \quad (20)$$

Why less aggressive? Future interest rate expectations

IS curve:

$$x_t = -\sigma i_t + \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} \beta^{T-t} ((1 - \beta)x_{T+1} - \sigma(\beta \textcolor{red}{i}_{T+1} - \pi_{T+1}) + \sigma r_T^n)$$

- Current interest rate i_t : one channel of policy
- Taylor rule implies interest rate expectation

$$\hat{\mathbb{E}}_t i_{t+k} = \psi_\pi \hat{\mathbb{E}}_t \pi_{t+k} + \psi_x \hat{\mathbb{E}}_t x_{t+k} \quad (20)$$

- If private sector understands and believes Taylor rule, expected future interest rates additional channel of policy
(Eusepi, Giannoni & Preston 2018)

Conclusion

First theory of monetary policy for potentially unanchored expectations

Estimation of novel unanchoring channel

- Expectations process nonlinear

Monetary policy

- Degree of expectations unanchoring determines extent of smoothing shocks
- **Key:** Optimal policy aggressive when unanchored, accommodates otherwise
- Taylor rule less aggressive than under rational expectations

Future work

- ↪ How to anchor at zero-lower bound?
- ↪ Other applications: currency crises

Appendix

Long-run expectations: responsive to short-run conditions?

Individual-level Survey of Professional Forecasters (SPF): for 1991-Q4 onward, estimate rolling regression

$$\Delta \bar{\pi}_t = \beta_0 + \beta_1^w f_{t|t-1} + \epsilon_t \quad (21)$$

$\bar{\pi}_t$ 10-year ahead inflation expectation

$f_{t|t-1} \equiv \pi_t - \mathbb{E}_{t-1} \pi_t$ individual one-year-ahead forecast error

w indexes windows of 20 quarters

Time-varying responsiveness

$$\Delta \bar{\pi}_t = \beta_0 + \beta_1^w f_{t|t-1} + \epsilon_t \quad (1)$$

Figure: Time series of $\hat{\beta}_1^w$

Breakeven inflation

Figure: Market-based inflation expectations, various horizons, %

Correcting the TIPS from liquidity risk

Figure: Market-based inflation expectations, 10 year, %

Robustness checks

$$\Delta \bar{\pi}_t = \beta_0 + \beta_1^w \pi_t + \epsilon_t \quad (1)$$

Figure: Time series of $\hat{\beta}_1^w$

Robustness checks - PCE core

$$\Delta \bar{\pi}_t = \beta_0^w + \beta_1^w f_{t|t-1} + \epsilon_t \quad (1)$$

Figure: Time series of $\hat{\beta}_1^w$

Robustness checks - controlling for inflation levels

$$\Delta \bar{\pi}_t = \beta_0^w + \beta_1^w f_{t|t-1} + \beta_2^w \pi_t + \epsilon_t \quad (1)$$

Figure: Time series of $\hat{\beta}_1^w$

Further evidence: disagreement

Figure: Livingston Survey of Firms:
Interquartile range of 10-year ahead inflation expectations

Percent of respondents indicating 3-year ahead inflation will be in a particular range

Further evidence: introspection

Figure: PCE core inflation against the Fed's target

Oscillatory dynamics in adaptive learning

Consider a stylized adaptive learning model in two equations:

$$\pi_t = \beta f_t + u_t \quad (22)$$

$$f_t = f_{t-1} + k(\pi_t - f_{t-1}) \quad (23)$$

Solve for the time series of expectations f_t

$$f_t = \underbrace{\frac{1 - k^{-1}}{1 - k^{-1}\beta}}_{\approx 1} f_{t-1} + \frac{k^{-1}}{1 - k^{-1}\beta} u_t \quad (24)$$

Solve for forecast error $f_t \equiv \pi_t - f_{t-1}$:

$$f_t = - \underbrace{\frac{1 - \beta}{1 - k\beta}}_{\lim_{k \rightarrow 1} = -1} f_{t-1} + \frac{1}{1 - k\beta} u_t \quad (25)$$

Functional forms for g in the literature

- Smooth anchoring function (Gobbi et al, 2019)

$$p = h(y_{t-1}) = A + \frac{BCe^{-Dy_{t-1}}}{(Ce^{-Dy_{t-1}} + 1)^2} \quad (26)$$

$p \equiv \text{Prob}(\text{liquidity trap regime})$
 y_{t-1} output gap

- Kinked anchoring function (Carvalho et al, 2019)

$$k_t = \begin{cases} \frac{1}{t} & \text{when } \theta_t < \bar{\theta} \\ k & \text{otherwise.} \end{cases} \quad (27)$$

θ_t criterion, $\bar{\theta}$ threshold value

Choices for criterion θ_t

- Carvalho et al. (2019)'s criterion

$$\theta_t^{CEMP} = \max |\Sigma^{-1}(\phi_{t-1} - T(\phi_{t-1}))| \quad (28)$$

Σ variance-covariance matrix of shocks

$T(\phi)$ mapping from PLM to ALM

- CUSUM-criterion

$$\omega_t = \omega_{t-1} + \kappa k_{t-1} (f_{t|t-1}' f_{t|t-1}' - \omega_{t-1}) \quad (29)$$

$$\theta_t^{CUSUM} = \theta_{t-1} + \kappa k_{t-1} (f_{t|t-1}' \omega_t^{-1} f_{t|t-1} - \theta_{t-1}) \quad (30)$$

ω_t estimated forecast-error variance

General updating algorithm

$$\phi_t = \left(\phi'_{t-1} + k_t R_t^{-1} \begin{bmatrix} 1 \\ s_{t-1} \end{bmatrix} \left(y_t - \phi_{t-1} \begin{bmatrix} 1 \\ s_{t-1} \end{bmatrix} \right) \right)' \quad (31)$$

$$R_t = R_{t-1} + k_t \left(\begin{bmatrix} 1 \\ s_{t-1} \end{bmatrix} [1 \quad s_{t-1}] - R_{t-1} \right) \quad (32)$$

Assumptions on $\mathbf{g}(\cdot)$

$$\mathbf{g}_{ff} \geq 0 \tag{33}$$

$\mathbf{g}(\cdot)$ convex in forecast errors.

Details on households and firms

Consumption:

$$C_t^i = \left[\int_0^1 c_t^i(j)^{\frac{\theta-1}{\theta}} dj \right]^{\frac{\theta}{\theta-1}} \quad (34)$$

$\theta > 1$: elasticity of substitution between varieties

Aggregate price level:

$$P_t = \left[\int_0^1 p_t(j)^{1-\theta} dj \right]^{\frac{1}{\theta-1}} \quad (35)$$

Profits:

$$\Pi_t^j = p_t(j)y_t(j) - w_t(j)f^{-1}(y_t(j)/A_t) \quad (36)$$

Stochastic discount factor

$$Q_{t,T} = \beta^{T-t} \frac{P_t U_c(C_T)}{P_T U_c(C_t)} \quad (37)$$

Derivations

Household FOCs

$$\hat{C}_t^i = \hat{\mathbb{E}}_t^i \hat{C}_{t+1}^i - \sigma(\hat{i}_t - \hat{\mathbb{E}}_t^i \hat{\pi}_{t+1}) \quad (38)$$

$$\hat{\mathbb{E}}_t^i \sum_{s=0}^{\infty} \beta^s \hat{C}_t^i = \omega_t^i + \hat{\mathbb{E}}_t^i \sum_{s=0}^{\infty} \beta^s \hat{Y}_t^i \quad (39)$$

where ‘hats’ denote log-linear approximation and $\omega_t^i \equiv \frac{(1+i_{t-1})B_{t-1}^i}{P_t Y^*}$.

1. Solve (38) backward to some date t , take expectations at t
 2. Sub in (39)
 3. Aggregate over households i
- Obtain (15)

Actual laws of motion

$$y_t = A_1 f_{a,t} + A_2 f_{b,t} + A_3 s_t \quad (40)$$

$$s_t = h s_{t-1} + \epsilon_t \quad (41)$$

where

$$y_t \equiv \begin{pmatrix} \pi_t \\ x_t \\ i_t \end{pmatrix} \quad s_t \equiv \begin{pmatrix} r_t^n \\ u_t \end{pmatrix} \quad (42)$$

and

$$f_{a,t} \equiv \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\alpha \beta)^{T-t} y_{T+1} \quad f_{b,t} \equiv \hat{\mathbb{E}}_t \sum_{T=t}^{\infty} (\beta)^{T-t} y_{T+1} \quad (43)$$

Piecewise linear approximation to gain function

$$\mathbf{g}(f_{t|t-1}) = \sum_i \gamma_i b_i(f_{t|t-1}) \quad (44)$$

- $b_i(f_{t|t-1})$ = piecewise linear basis
- γ_i = approximating coefficient at node i

↪ Estimate $\hat{\gamma}$ via simulated method of moments

The expectation process over time

Figure: Time series of forecast errors, changes in long-run expectations and gain

Target criterion

Proposition

In the model with anchoring, monetary policy optimally brings about the following target relationship between inflation and the output gap

$$\pi_t = -\frac{\lambda_x}{\kappa} x_t + \frac{\lambda_x}{\kappa} \frac{(1-\alpha)\beta}{1-\alpha\beta} \left(k_t + f_{t|t-1} \mathbf{g}_{\pi,t} \right) \left(\mathbb{E}_t \sum_{i=1}^{\infty} x_{t+i} \prod_{j=0}^{i-1} (1 - k_{t+1+j} - f_{t+1+j|t+j} \mathbf{g}_{\pi,t+j}) \right)$$

where $\mathbf{g}_{z,t} \equiv \frac{\partial \mathbf{g}}{\partial \mathbf{z}}$ at t , and b_1 is the first row of b .

Lemma

The discretion and commitment solutions of the Ramsey problem coincide.

► Why no commitment?

Corollary

Optimal policy under adaptive learning is time-consistent.

No commitment - no lagged multipliers

Simplified version of the model: planner chooses $\{\pi_t, x_t, f_t, k_t\}_{t=t_0}^{\infty}$ to minimize

$$\mathcal{L} = \mathbb{E}_{t_0} \sum_{t=t_0}^{\infty} \beta^{t-t_0} \left\{ \pi_t^2 + \lambda x_t^2 + \varphi_{1,t}(\pi_t - \kappa x_t - \beta f_t + u_t) \right. \\ \left. + \varphi_{2,t}(f_t - f_{t-1} - k_t(\pi_t - f_{t-1})) + \varphi_{3,t}(k_t - \mathbf{g}(\pi_t - f_{t-1})) \right\}$$

$$2\pi_t + 2\frac{\lambda}{\kappa}x_t - \varphi_{2,t}(k_t + \mathbf{g}_{\pi}(\pi_t - f_{t-1})) = 0 \quad (45)$$

$$-2\beta\frac{\lambda}{\kappa}x_t + \varphi_{2,t} - \varphi_{2,t+1}(1 - k_{t+1} - \mathbf{g}_f(\pi_{t+1} - f_t)) = 0 \quad (46)$$

Target criterion system for anchoring function as changes of the gain

$$\begin{aligned} \varphi_{6,t} = & -cf_{t|t-1}x_{t+1} + \left(1 + \frac{f_{t|t-1}}{f_{t+1|t}}(1 - k_{t+1}) - f_{t|t-1}\mathbf{g}_{\pi,t}\right)\varphi_{6,t+1} \\ & - \frac{f_{t|t-1}}{f_{t+1|t}}(1 - k_{t+1})\varphi_{6,t+2} \end{aligned} \quad (47)$$

$$0 = 2\pi_t + 2\frac{\lambda_x}{\kappa}x_t - \left(\frac{k_t}{f_{t|t-1}} + \mathbf{g}_{\pi,t}\right)\varphi_{6,t} + \frac{k_t}{f_{t|t-1}}\varphi_{6,t+1} \quad (48)$$

$\varphi_{6,t}$ Lagrange multiplier on anchoring function

The solution to (48) is given by:

$$\varphi_{6,t} = -2\mathbb{E}_t \sum_{i=0}^{\infty} \left(\pi_{t+i} + \frac{\lambda_x}{\kappa}x_{t+i}\right) \prod_{j=0}^{i-1} \frac{\frac{k_{t+j}}{f_{t+j|t+j-1}}}{\frac{k_{t+j}}{f_{t+j|t+j-1}} + \mathbf{g}_{\pi,t+j}} \quad (49)$$

Respond but not too much

Figure: Impulse responses for unanchored expectations for various values of ψ_π
