STOCHASTIC OBTIMIZATION IN CONTINHOUS FWU-RAND (MANG TIME (3) Stochastic Calculus A different al equation: (31)  $X = \mu(t, x)$ can be un ben as dx = m(t,x) dt and extended to be stochastic as (3.2) dx += p(t, x4) dt + 3(t, x4) dW4 What is a Wilner procles? Led 18 The "3D analog" of WN -> it's the limiting process of a random wall when you let the time interval go to zero Note: a Wiener process is also a special use of Markor processes w/ normally distributed transition probability. H is also known of Brownian motion, is continuous and nowhere differentiable.

"Big O" notation S = O(JAt) if S > 0 at the rate dot, 1.1. lim 5 = L st >0 St = L for k constand. Little O" notation S= o( Dt) y S->0 fusker than Dt  $\lim_{\Delta t \to 0} \frac{5}{\Delta t} = 0$ For Wilner provenes, even w/ line we belled about the independent incoment poperty, i.e. w(t) - w(s) + w(s) - w(0) in words: The step(s) The process takes form time tand 5 is lave independent from the ones between 5 and 0. ( Note that the RW fulfuls his too.) The probability density of a wiener process is (2,17

But eq. (3.2) is not just (3.1) + random shorli So (3.2) does not represent the denontrine of  $(x_1)$  writ time,  $(x_2)$   $(x_3)$ What is the meaning Then of (3.2)? Note that a differential equation has an integral interpretation:  $\dot{x} = \mu(t,x)$  in (3.1) is equivalent to  $x_t - x_0 = \int_0^T \mu(s, x) ds$ i.e. "x evolves in time as  $\mu(t,x)$  is equipled to saying that the change in x between 0 and t is the sum of all The steps in pe(s,x) over Mest the honton. + 3(t, X) 1W Similarly, dx+= p(t, X) dt is (3.2) is equivalent to  $X_4 - X_{10} = \int_{10}^{10} \mu(s, X_s) ds + \int_{10}^{10} 3(s, X_s) dW_s$  (3.3) which means that a sol to (3.3) is a sol to (3.2)!

(Provided that ft & (s, xs) dws exists.) 1.) St b(s, xs) dWs is not a Riemann Integral. why? B/c a Riemann integral is one which you can unite as a sum of D-s for the partitioned spaces between to and t when the number of these partitions -> 00. But Sto B(+, X+) dW+ is not independent of The choice of intermediate points of a protition of [to, T]. The reason is that the subsideral It Wor Dut is also not liemann integrable. 2) Search for a dans of purchons 3(5, x5) em... integral which will somethow be the sol to (3.3).

P. 65 The los Indegral Probubility space (SZ, F,P) Det A family of 3-algebras of Z.: t & I's is called a filtration i.e. an increasing family, If F5C FrCF whenever 5 = t. In words: a filtration is a sequence of sets in which the most recent ones encompass their predecerors. E.g. info sets. Point set SL The set of elementary events in prot theory Power set 25h The set of all subsets of SZ Algebra / field (i)  $A \in \mathcal{Z} \Rightarrow A^c \in \mathcal{Z}$  subsets of  $\Omega$  (i.e.  $\mathcal{Z} \subset 2^2$ ) of (ii) A, B & Z => AUB & Z => ANB & Z (iii) sez spez

Def. A set punction P Z -> R is a probability meanor if P satisfics (i)  $0 \le P(A) \le A \quad \forall A \in \mathcal{X}$ (ii) P(p) = 0 and P(52) = 1 5 ez a "valami majd csak lesz" (iii) if A; E & and A; an mutually disjoint, then  $P(\overline{U}_{A_i}) = \sum_{i=1}^{n} P(A_i)$ Lo (ii) is called countable additioning The triplet (2, 7, 1) are a probability space. When Q=R or S2=[0,1] and the b-algebra is the one generated by The open sets in R or in [0,1], then this B- algebra is called the Bord field, B. An element in the Bord field is a Bord set

When 2 = [0,1], the 3-algebra is 25, and P(A) is the "length" (measure) of AEZ, Then P is the probability measure on B and is known as The Lebesgue meaning on [0,1]. H seems also as if being a Bood set meant That the set is EIR (or [0,1]) and is observable. The 100 Indegral. Corst Def Ito indeaport of a stop function 2(t, w) is  $I(b)(\omega) = \int_{t_0}^{t_0} b(t,\omega) dW(t) = \sum_{i=0}^{n-1} b(t_i,\omega) \left[ W(t_{i+n}) - W(t_i) \right]$ il. it's the Riemann sum evaluated at the left endprents are to integral is a random unable.

Def. Some an's + m(t, w) is integrable i.e.  $\int_{0}^{\pi} |\mu(t,\omega)| ds < \infty$ So Mast + + Sto M(S, W) ds + Sto b(S, W) d Ws then we say that  $\mu(t,\omega)dt + b(t,\omega)dW$  is The stochastic differential of the process and we denote it by dx. It is who called an the process. Def. A process  $X_{+}$  is a machingale if  $E[X_{+}|X_{5}] = E[X_{5}|X_{5}] = X_{5} \qquad (3.17)$ [Maide for + > 51 Numb for +>5. Note the Wiener process satisfies (3.12), and so it's a mashingale. Xs & E[Xs | Zs] -> submarkingale Xs Z E [Xs | Zs] -> supermattingele The Ito integral can be used to generate marhngales.

p. 77 Ho's Lemma - Antonomons case (3.2): dx += \mu(t, x\_4) dt + 3(t, x\_4) dw4 is autonomous when the drift m(+, X+) and The instantaneous miance 2(t, X+) are independent of time: (3.13) dx+ = m(x1) dt + 2(x+) dW+ Ho's Lemma is essentially the stochastic version of the chain rule for differentiation. It answers The question of it X+ satisfies (3.13), and Y+ = h(K+), Then what's dY7? In the determinisher case, if x = f(x), y = h(x), Then  $\frac{dy}{dt} = \frac{d}{dt} \left[ h(x) \right] = h'(x) \dot{x} = h'(x) f(x)$ . Ho's lemma of h(x) is twile different able, men dr+ = h(x1) p(x+) d+ + 2(x1) dW4] + 3 h" (x4) 3 (x+) H this 2nd order Taylor tem shows up

Xiao in Lect 20 sups (p. 5, Mac) BM, a continuous pt of a BM, it holds that df(w(t)) = f'(w(t)) & w(t) + = f'(w(t)) dt Or, more generally, for B(r)~BM(102) df(B(t)) = f'(B(t)) d B(t) + \omega^2 f"(B(t)) /t .. and Kino emphasizes that & this 2nd order term in mis "stochastic chain mel differentiation" is the reason why the stochastic integral (i.e. the stockistic differential equation) is not a Rilmann indegral, ble for Riemann integrals, the 2nd order tem would be negligible! Note that we're made use of the planing "multiplication tuble: X (dW) dt dw dt 0 dt 0 p.79

Def. geometric Brownian Mohon

dx+ = ax, d+ + bx+ dW+ (3.16) And it has a closed-form sol:  $X(t) = X(0) \cdot \exp\{(a-b_{\frac{3}{2}})t^{\frac{3}{2}} \exp\{bW(t)\}^{\frac{3}{2}} (317)$ Its discrete time counterport is X++1 = (1+a) X+ + b X4 E++1 Prope  $E(x(t)) = x(0) e^{at}$  for  $x_{+} \sim geom BM$   $Var(x(t)) = x^{2}(0) e^{2at} (e^{5^{2}t} - 1)$ Ex. Population dynamics is described by X; (t+h) = nh + 3 7(t,h) + 2; E; (t,h) # Mongring capabled pop system-will ilio shoot from person i growth rate shorte dus, despite being discrete time, can be approximated using the geom. Brownian motion (3.19) dL = nLdt + bLdW and the proposition allows us to directore pop.

Additive vs. multiplication shortes dL=nldt + 2 Ldw (mulliphicative) (3.15) ED dL = ndt + bdw => men L(t) >0 tt dL = nLdt + bdW (allitine) (change to pop. doesn't depend on level) in men L(t) < 0 w/ prot > 0, small. To make life harder, the book now snikhes to the notation 2, for the wiener process W'(+). Mulhrandte Ho's Lemma Let W' be a Wiener prouss satisfying (d21)(121) = 2 lt, 2= convoef (2+, 2;) 4 X+ follows (3.13). dx+= m(x1)dt + 3(x+)d2 and 4 follows d4 = 2(4) d+ + O(4) 12, and Zt = h(Xt, Yt), ht C2, Men dz+ = hx (mdt + bdz+) + hx (vdt + 8dz+) 4 = hxx d+ + = hyydt + 260 hxy dt (3.22)

Non-autonomous Ito's Lemma X+ follows (3.2): dx + = p(t, x+) dt + 3(t, X+) d2+ H(t, X4) & C 12. Then dH(t, xx) = 44 dt + 14 (pdt + 3 d 24) + 3 32 Hxx dt new term compared to autonomous case.
